DAYTONA AIR FILTER CLEANING INSTRUCTIONS

Remove filter and bump lightly to dislodge any heavy dirt buildup. Use a light detergent like Dawn dishwashing liquid, diluted Simple Green, or Orange cleaner, along with a bucket of hot water. Swish around and then rinse with clean water. **DO NOT USE EXCESS WATER PRESSURE OR AN AIR HOSE TO RINSE AND DRY!!** Let the filter dry **OVERNIGHT**, and then re-oil with **AIR FILTER OIL**, available at any local Auto Parts Store. A little oil goes a long way! It is a slow process to do correctly, not something you do in a few minutes!!

WE HIGHLY recommend you purchase and use the **K&N filter care service kit**, available at any Local Auto Parts Store, and follow the instructions.

When do I clean my DAYTONA AIR FILTER?

Cleaning your DAYTONA AIR FILTER is not required if you can still see the wire screen on the entire air filter, regardless of how dirty it may appear. If you have not experienced a decrease in mileage or engine performance, chances are your DAYTONA AIR FILTER is fine and does not yet need to be cleaned. When the screen is no longer visible some place on the air filter, it is time to clean it. Check out these photos of dirty and clean air filters to help determine if your DAYTONA AIR FILTER needs cleaning.
